SELECTED PROJECTS

- **Detection and Tracking of subject in a video based on a given template**
  - Extracted HOG based features for the template from the first frame of the video
  - Trained a discriminative classifier (linear SVM) to distinguish between the subject and background based on HOG features, using a sliding window approach
  - Code availability : https://github.com/MohammadYasar/ObjectTracking
- **Intrusion Detection System for tele-operated surgery**
  - Designed the pipeline for detecting the presence of an intruder in the robot network
  - Distinguished between normal tele-operation and abnormal behavior by leveraging previously recorded data patterns
  - Code availability : https://github.com/MohammadYasar/SWSecurity/
- **Generic interface for applying machine learning tools to detect fraudulent transactions**
  - Designed the pipeline for data preprocessing and feature selection based on the highest correlation to the output
  - Trained and validated different classification models (kNN, SVM, XGBoost, Random Forest) using double cross validation
  - Code availability: https://github.com/MohammadYasar/MachineLearningGenericInterface
- **Hand-held game with adaptive difficulty based on player performance**
  - Developed a cube game, which evaluates the player's performance based on the number of cubes hit in a given time, on top of a Real Time Operating System
  - Adapted the difficulty of the game depending on how the player performs
